

SMY 133

Power Monitor and Data Logger

Typical applications: wide area power quality monitoring in smart grids, live supervision with SCADA, industrial and commercial automation, sub-metering, energy and demand side management.

SMY 133 is an advanced 3-phase multimeter and data logger with large color LCD display. Instrument is designed for monitoring in single- and three-phase MV and HV distribution network stations as well as in regular LV cabinets.

It includes per-phase and three phase active energy meter with separated generation / consumption readings and reactive energy, measured in all four quadrants.

Programmable relays or pulse outputs can control other equipment based on measured values (fan control, over voltage/over current etc). SO digital outputs translates embedded electricity meter energies to pulses.

Key features:

- three-phase active and reactive energy meter (kWh, kvarh, L, C, +, -) measures in 4 quadrants
- energy: active 0.5S acc. IEC 62053-22, reactive class 2 (1) acc. IEC 62053-23
- voltage and current: class 0.2, active power 0.5 according to IEC 61557-12
- programmable pulse or relay outputs (option RR, RI, II), built-in temperature, binary input
- 512 MB of internal memory for data logging and energy recording
- continuous sampling 128 s./period, 6.4 kHz, direct & indirect measurement (with VT and CT)
- local USB, optional remote RS 485 or Ethernet communication

Communication Interface

N = USB, no remote comm. link

4 = USB, RS-485

E = USB, Ethernet 10BaseT

Optional firmware modules

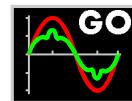

PQ S Module

Module for evaluation of power quality according to EN 50160 (class S). Enables measurement and recording of flicker indices, interharmonics and voltage events. Power quality is evaluated weekly and stored to special PQ Main archive for future processing.

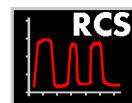

GO module

Module for detection and precise recording of various waveform distortions. This module records the so called oscillograms of voltages and currents in extended detail, capacity and trigger options into the flash memory.

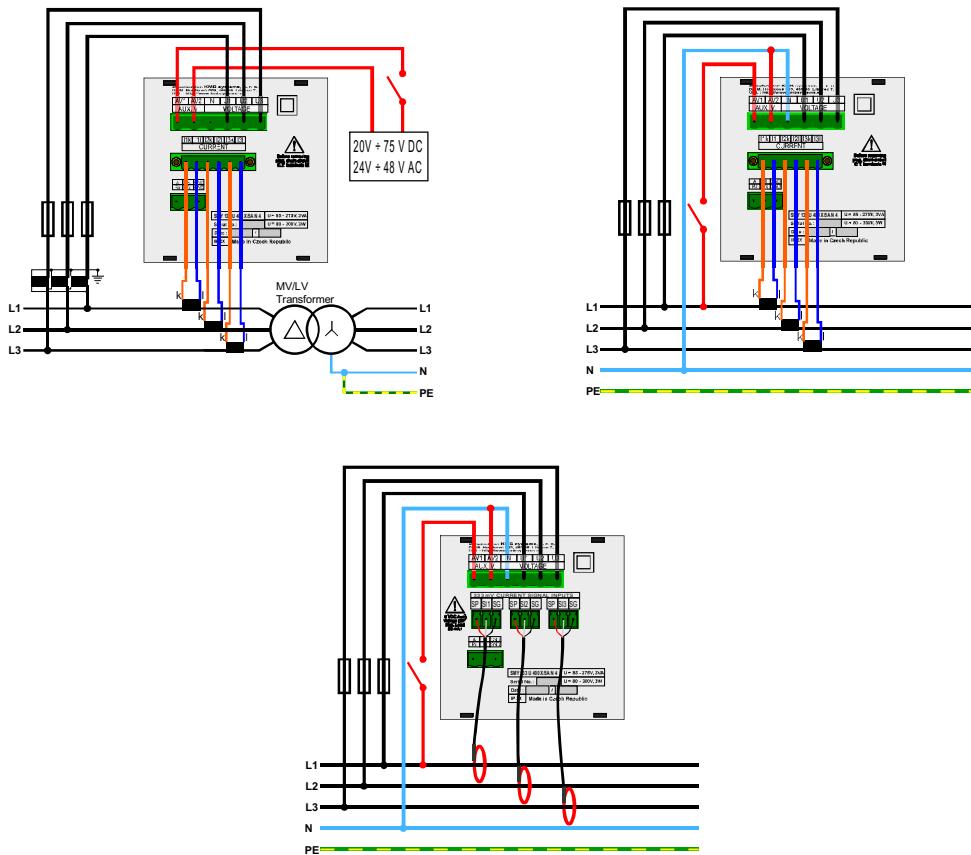

RCS module

The RCS module (ripple control signal, mains voltage or signalling voltage) activates an ability to detect, evaluate, decode and store RCS messages transmitted over the monitored distribution network. It precisely measures voltage on the selected frequency and stores the extracted information into a special archive in memory.
